ALGERIAMONSOON TIME SCALE

GANGADHARA RAO IRLAPATI H.NO.5-30-4/1, SAIBABANAGAR, JEEDIMETLA, HYDERABAD - 500 055, TELANGANA, INDIA.

EMAIL:scientistgangadhar@gmail.com

<u>ABSTRACT</u>: In the summer months, temperature's in deserts regions of Algeria can hit 50⁰ C. But nights in the sahara are often cold in winter, temperatures can dip below freezing. The north of Algeria is cooler, enjoying a Mediterranean –style climate.

Droughts and increasing desertification, where the desert is encroaching into semi-drip grass lands, have forced some herders to abandon their traditional farming – livelihoods and look for work in the cities.

Algeria subject to severe earth quakes, mudslides and floods in rainy seasons.

In Algeria coastal area have a mild climate which means hot in the summer and cool and rainy in the winter. In the highlands summer are hot and dry winter rains in the highlands begin in October. There are four main seasons fall, winter, spring and summer in the Algeria.

KEY WORDS: Algeria Monsoon Time Scale,

INTRODUCTION:

By establishing the AlgeriaMonsoon Time Scale and maintain, the country can be estimated the impending weather conditions and natural calamities rains, floods, droughts and winds etc in advance. Surface water resources can stil be found.

ALGERIAMONSOON TIME SCALE:

Algeriamonsoon does not mean that Algeriahas a separate monsoon. Monsoon means a seasonal reversing accompanied by its corresponding weather and natural calamities precipitation. We cannot be said that a monsoon especially to be relevant to a particular country. In every country, every year, in a certain order seasonal winds are repeating. Each and every country has its monsoon winds and conditions. Keeping in view of all above geographical facts and circumstances, after studying the weather conditions and natural disasters in the Argentina, I have proposed a time scale to measure the seasonal winds of the country that is the AlgeriaMonsoon Time scale.

This is very useful to study the Algeriaweather changes and natural calamities such as monsoon movements, rains and other weather changes in advance. The AlgeriaMonsoon Time Scale – a Chronological sequence of events arranged in between time and weather with the help of a scale for studying the past's, present and future movements of monsoon in the Algeriaand its relationship with rainfall and

other weather conditions and natural calamities of the country.

Prepare the AlgeriaMonsoon Time Scale having 365 horizontal days from March 21st to next year March 20th of a required period comprising of a large time and weather have been taken and framed into a square graphic scale. The main weather events if any of the Algeriahave been entering on the scale as per date and month of the each and every year. If we have been managing the scale in this manner continuously, we can study the past, present and future movements of the monsoon and other weather and its weather conditions and natural calamities of the country. The AlgeriaMonsoon Time Scale reveals many secrets of the monsoon and weather and its relationship with rainfall & other weather problems and natural calamities of the country. The tracking date of main path & other various paths of the monsoon winds on the graph, denotes the onset of the monsoon and weather changes, monsoon pulses or low pressure systems, cyclones and other disturbances etc. And also we can find out many more secrets of the monsoon or weather conditions of the Algeriasuch as droughts, famines, cyclones, heavy rains, floods etc in the country by keen study of the AlgeriaMonsoon Time Scale.

USES:

By development of the AlgeriaMonsoon Time Scale and maintain, the can be study and predict the monsoon movements, weather changes and its related impending weather conditions and natural

calamities rains, floods, landslides, avalanches, blizzard and droughts, extreme winter conditions, heavy rainfall, mudflows, extreme weather, cyclones, cloud burst, sand storms, hails, and winds etc in advance.

GLOBAL MONSOON TIME SCALES:

The global Monsoon Time Scale – a Chronological sequence of events arranged in between time and weather with the help of a scale for studying the past's, present and future movements of monsoon of a country and its relationship with rainfall and other weather problem and natural calamities.

GLOBAL MONSOON TIME SCALES

African Monsoon Time Scale North American Monsoon Time Scale Asian Monsoon Time Scale Australian Monsoon Time Scale European Monsoon Time Scale

REGIONAL MONSOON TIME SCALES

North American Monsoon Time Scale North African Monsoon Time Scale Indian Monsoon Time Scale Western North Pacific Monsoon Time Scale South American Monsoon Time Scale South African Monsoon Time Scale Australian Monsoon Time Scale East Asian Monsoon Time Scale

Prepare the Global Monsoon Time Scale having 365 horizontal days from March 21st to next year March 20th of a required period comprising of a large time and weather have been taken and framed into a square graphic scale. The main weather events if any of the country have been entering on the scale as per date and month of the each and every year. If we have been managing the scale of a country in this manner continuously, we can study the past, present and future movements of monsoon of a country. We can make separate monsoon time scales per each and every individual country.

SUB-REGIONAL MONSOON TIME SCALES

South Asian Monsoon Time Scale
Maritime Continent Monsoon Time Scale
East African Monsoon Time Scale
West African Monsoon Time Scale
Indo-Australian Monsoon Time Scale
Asian-Australian Monsoon Time Scale
Malaysian Australian Monsoon Time Scale
Northern Australian Monsoon Time Scale
Arizona Monsoon Time Scale
Arizona Monsoon Time Scale
South-West Monsoon Time Scale
North-East Monsoon Time Scale
South East Asian Monsoon Time Scale

INDIAN MONSOON TIME SCALE:

For example, I have prepared the monsoon time scale for India by preparing the scale having 365 horizontal days from 1st April to next year March 31st of 128 years from 1888 to 2016 of the required period comprising of large time and weather have been taken and framed into a square graphic scale. The monsoon pulses in the form of low pressure systems over the Indian region have been entering on the scale in stages by 1 for low, 2 for depression, 3 for storm, 4 for severe storm and 5 for severe storm with core of hurricane winds pertaining to the date and month of the each and every year. If we have been managing the scale in this manner continuously, we can study the past' present's and future's of the India Monsoon and its relationship with rainfall and other weather problems & natural calamities in India.

ANALYSIS:

The India Monsoon Time Scale reveals many secrets of the Indian monsoon and its relationship with rainfall & other weather problems and natural calamities. For example, some bands, clusters and paths of low pressure systems along with the main paths of the Indian Monsoon (South-east monsoon and north-west monsoon) clearly

seen in the map of the Indian monsoon it have been some cut-edged paths passing through its systematic zigzag cycles in ascending and descending orders which causes heavy rains & floods in some years and droughts & famines in another years according to their travel. For example, during 1871-1990's, the main path of the Indian Monsoon was rising over June, July, August and creating heavy rains and floods in most years. During 1900-1920's, it was August, September and raising over resulting good rainfall in more years. During 1965-2004's it was falling over September and causing low rainfall and droughts in many years. At present it is rising upwards over June, July, August, September and will be resulting heavy rains & floods in coming years during 2004-2060. The tracking date of main path & other various paths such as south-east monsoon and north-west monsoon etc., of the Indian Monsoon denotes the onset of the monsoon, monsoon pulses or low pressure systems. And also we can find out many more secrets of the Indian monsoon such as droughts, famines, cyclones, heavy rains, floods, real images of the Indian monsoon, and onset withdrawals of south east monsoon and north-west monsoon etc. by keen study of the Indian Monsoon Time Scale.

PRINCIPLE:

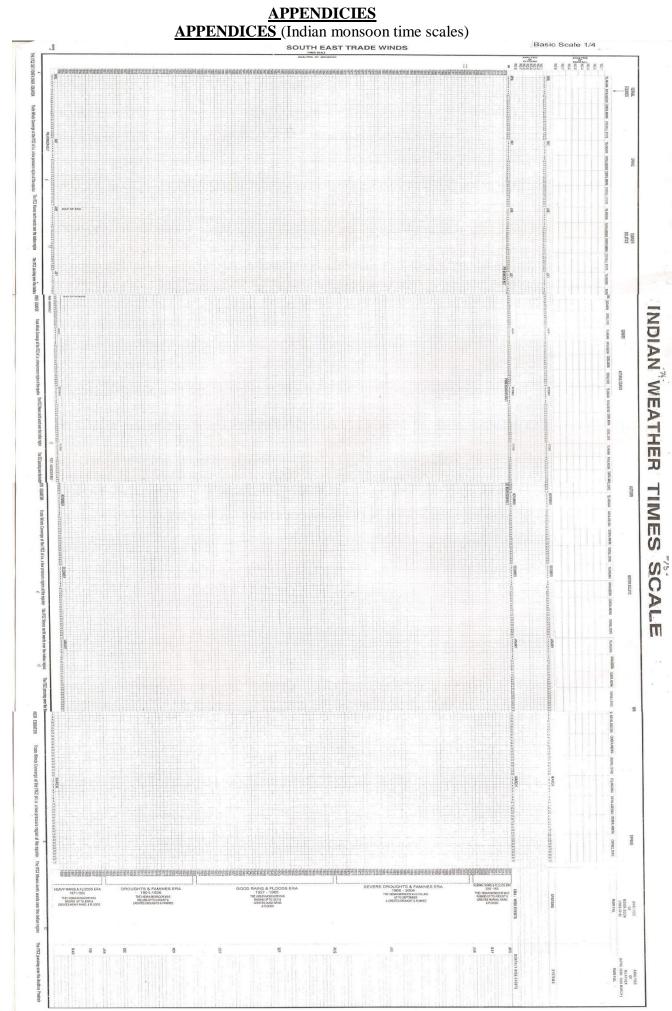

This is an Astrogeophysical / Astrometeorological phenomenon of effects of astronomical bodies and forces on the earth's geophysical atmosphere. The cause is unknown however the year to year change of movement of axis of the earth inclined at 23½ degrees from vertical to its path around the sun does play a significant role in formation of clusters, bands & paths of the Indian Monsoon and stimulates the Indian weather. The inter-tropical convergence zone at the equator follows the movement of the sun and shifts north of the equator merges with the heat low pressure zone created by the rising heat of the subcontinent due to direct and converging rays of the summer sun on the India Sub-Continent and develops into the monsoon trough and maintain monsoon circulation.

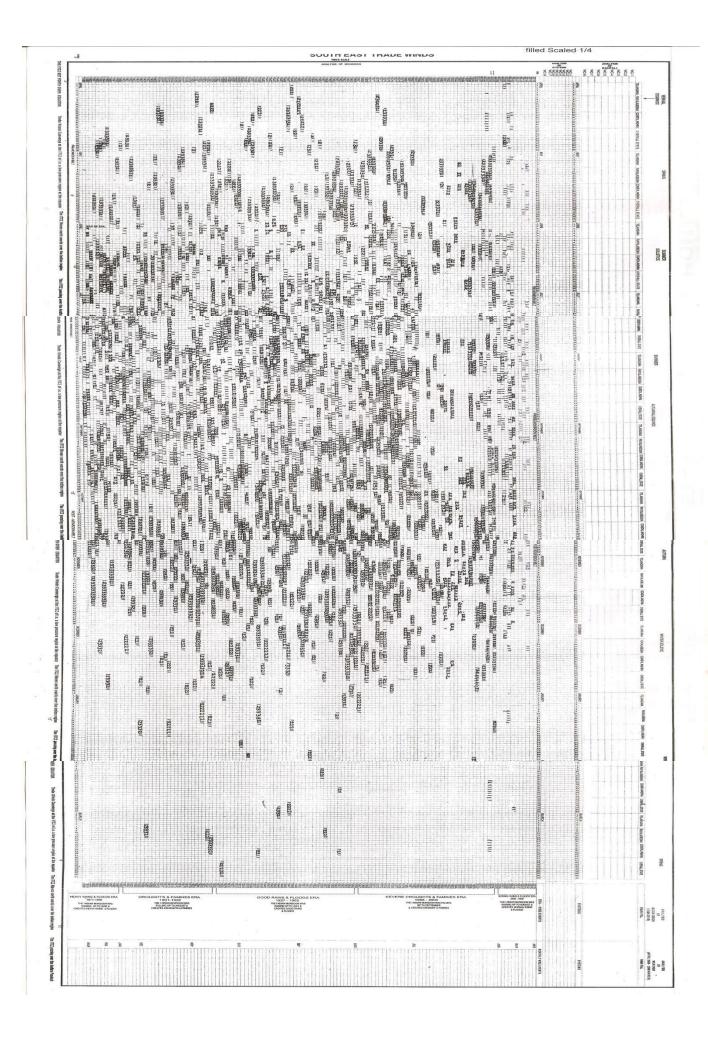

CONCLUSION:

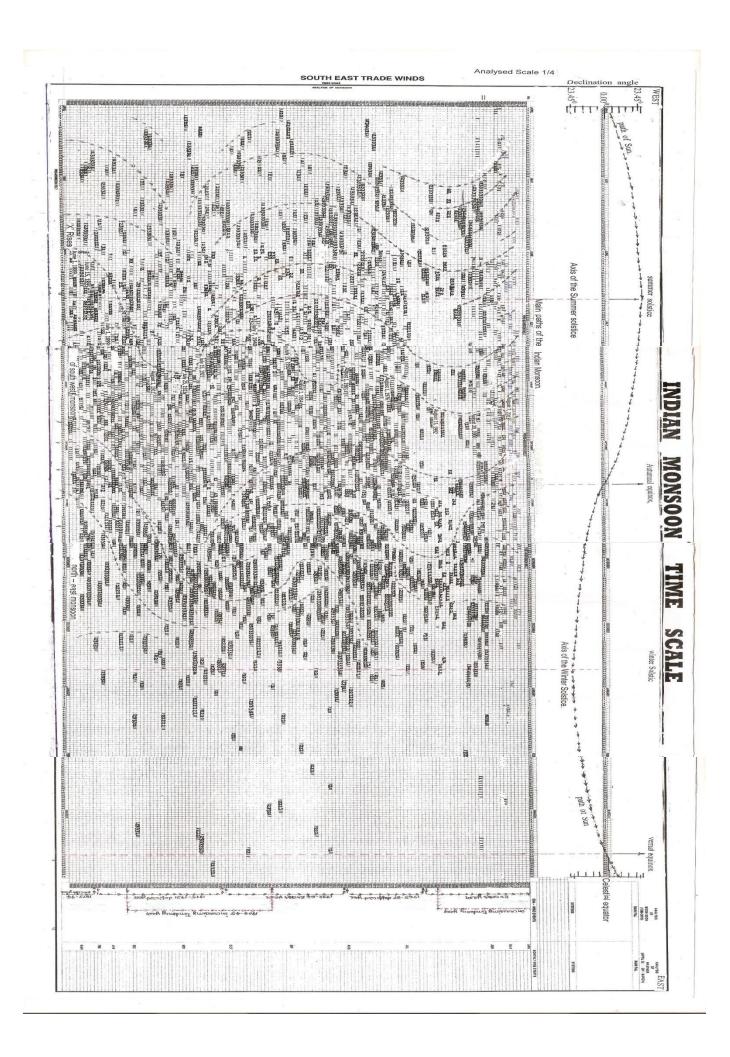

We can make many studies on the weather conditions and natural calamities of the country thus inventing many more forecasting systems and proposing mitigative measures for the welfare of people of the country Argentina.
